Concept of crossing rehabilitation

As rainfall events become more frequent and intense, maintaining reliable drainage infrastructure is essential.

This project will rehabilitate the creek crossing at 39th Avenue to ensure it continues to safely carry stormwater during periods of heavy rainfall.

This project is a proactive investment that will extend the life of the 39th Avenue crossing by at least 25 years, reduce the risk of flooding, and costs of future repairs.

A recent assessment of creek crossings across the city identified this location as a high priority. Crews will use trenchless rehabilitation methods so repairs can be completed with minimal disruption to traffic and surrounding areas.
